

Free Python Training introduction

Hello, and welcome to your Python training!

We are always excited to have a new student join our team, no matter what background or knowledge you have – you are most welcome and we hope to have a long relationship working with you.

You are about to embark on training the powerful programming language. Python, which is used around the world for millions of tasks. This training is unique because it will expose you to the applications of Python and computer programming to new and exciting fields such as Artificial Intelligence, Machine Learning, Natural Language Processing and Bioinformatics while you learn Python. Real problems in these fields will be introduced as early as Task 3 and you will write Python code to solve these problems. I will take every effort to also explain the relevant science behind these problems for example:

- Why computers have trouble understanding human speech and how computer programs advance to try solve this, especially Python and the Natural Language Processing Toolkit.
- How we can try to make “decision making robots”, such as chess AI, and determining what their limitations are.
- ‘How we can use Bioinformatics to understand how HIV evolves to survive the drugs we use to combat it’.

Our curriculum is built from a wide variety of sources. We have taken programming exercises, notes and tasks from some of the most advanced and cutting edge Computer Science programs in the world - [such as the University of Edinburgh AI department](#) - the most advanced AI research department in the world.

How does it work?

A teacher has setup your [Dropbox](#) folder. In this folder, you should be able to see another folder called Task 1. Open this folder and read the file named 'Instructions' to find out what you need to do for this task. Task 1 is a bare bones foundation to Python and many of the concepts in Task 1 are applicable to all programming languages such as Java, Haskell etc. Please keep all files and work inside the relevant Task folder located inside your Dropbox.

Please make sure you have Python and Notepad++ installed before continuing. Visit <http://rmoola.com/pythonlessons.html> on instructions on how to set these up. **You should open all .txt and .py documents in Notepad++.**

How Dropbox works:

Every single file you change in this Dropbox folder will **immediately** be seen by our tutors. That means as soon as you create a new file in this folder, we'll be able to see it. If you edit that file, as soon as you save it it will also be updated on our tutors computers. Our tutors can also access your files in this folder and make changes and then save them - you'll be able to see their changes right away and you'll get a popup notification in the bottom right of your screen everytime this

happens. Go ahead and make a new textfile in this folder called '**Comments**' and inside the document write your name and save the file - our tutors will use it right away!

We highly recommend you visit www.dropbox.com/events and sign in. This website will give you a list of all changes in your Dropbox folder, **even while you were offline**. So if while you were sleeping we checked your work, in the morning you may want to visit that website to get a full detailed list of what changed rather than having to open your Dropbox folder and check each file individually!

The structure of each Task:

Each task folder will generally contain:

- An "example.py" Python file with example code and extensive commenting to help you learn new concepts.
- Optional programming exercises can be found throughout the comments in "example.py" in the 'Playing around with Python' sections.
- One compulsory exercise is given at the end of "examples.py". You must complete this exercise correctly in order to be given the next Task.
- Bonus optional exercises are given. Optional extra reading on the subject material of the task which can range from simple Python notes to scientific papers/external university resources on interesting and relevant topics.

An outline of the Python syllabus:

- **Task 1** – A strong introduction to the fundamental concepts of Python including control and data structures, variables and running and writing Python programs.
- **Task 2** – An introduction to more advanced concepts such as file I/O, creating functions and using other Python modules.
- **Task 3: Bioinformatics** – An introduction to Bioinformatics, DNA sequences, and using Python to solve problems in these fields. Bioinformatics in South Africa and abroad.
- **Task 4: Natural Language Processing** – An introduction to Natural Language Processing, with slides, notes and exercises from the University of Edinburgh in Scotland. Programming using the Python Natural Language Toolkit.
- **Task 5: Python on the web** – An introduction to writing Python scripts on web servers and an example from previous South African Medical Research Council work for the means of displaying Javascript graphs.
- **Task 6: Artificial Intelligence** – An introduction to some concepts in Artificial Intelligence including using Python for constraint satisfaction problems. Slides and examples from the University of Pennsylvania and the University of Edinburgh courses with programming exercises from the same.

- **Task 7: Cloud Computing** – Introducing the concept of Cloud Computing, using the Amazon Cloud for free and setting up and working with Ubuntu (Linux) servers to understand how we can take advantage of cloud computing.

More tasks in development. Please submit any suggestions you have to students@hyperiondev.com. As you can see, complete more tasks, and the programming exercises and problems will become more interesting and advanced – but you will get to work at your own pace.

Getting help:

If you have absolutely any problems, queries or requests, please email us on students@hyperiondev.com and a teacher will get back to you immediately. You can also add the above address to Google Chat or add hyperion.development on Skype to get one on one video call help.

You can also post on our Facebook group wall located at www.facebook.com/hyperiondev.

Make sure to check your Dropbox regularly and to also visit <http://rmoola.com/advice.html> for some advice and <http://rmoola.com/founders.html> to see some frequently asked questions.

Paid projects:

After you complete the first two tasks, you will be eligible for paid and unpaid projects with our clients. Please contact students@hyperiondev.com to express interest in this, or in the case of fast progress you will be approached! Title your email as 'Interest in paid project'.

I'm having trouble reading the documents:

When you open instructions.txt it should **not** look like this:

```

example.py - Notepad
File Edit Format View Help

#This is a comment in python. Comments can be placed anywhere in Python code and the computer ignores them - they are intended to be read by humans.
#Assign the number 2 to the variable 'num' num = 3 #Now 3 overwrites the 2 that was initially stored in num#when coding Python, you can use variables.
#If you close this black box, and open a new one and type: print name, you will get an error. #In the first line, type: name = raw_input("Enter your name")
#This is a popup box like JOptionPane.showInputDialog in Java. The variable name stores a String. #In the first line, type: name = raw_input("Enter your name")
#Now write click your new input/output.py file and click 'Edit with Notepad++'

#Sometimes you need to convert from one variable from one type to another.
#You're over 18 and can come in'else: print "You're too young sorry" #whatever is indented to the right of the colon: don't forget to print
#(which is an integer) is in the range of 1 to 10 (ie either 1, 2, 3, 4, 5, 6 ... or 10), the code under the for loop will execute. range(1, 10) is an array which in python is known as a list. There are 3 String items in this list. #we can dive into a list and get a single item.
#NB. LISTS are not totally like java ARRAYS. They do NOT have a fixed limit you have to set at the start. #We can dive into a list and get a single item.
#lets call that integer n. Then using a for loop, the user gets to add n items to a list. Print the list out at the end of the loop.
#It is helpful to think like this before starting to write a program.
#Imagine if the list had 100 items, 3 items or no items. The logic is the same and can be done in one line in python. items = ['milk', 'bread', 'eggs', 'butter', 'jam', 'honey', 'milk', 'bread', 'eggs', 'butter', 'jam', 'honey']
#The condition i < 14 will always be true because you never change i in the while loop -> be careful! #while loops are useful for validation.
#The difference between assigning things to variables and checking if a variable has a certain value is that you can't assign a value to a variable.
#If name == "A" and name == "B": print "this code will never execute because name can't be both the string A and B at the same time."
#CHECKPOINT.
#This does not work, Python is not set up correctly on your command line and you should email moolriaz@gmail.com for help. #OPTION 2: Run from IDE
#required to read the entire thing. #Now, time to write your first simple Python program in order to move on to Task 2 and even more exciting Python programs.

```

Rather, it should like this:

```
1  #This is a comment in python. Comments can be placed anywhere in Python code and the computer ignores them - t
2

31 #=====
32
33 #You get different types of variables : Strings, Ints and Floats
34 #Ints store integers (ie whole numbers).
35 #String store text and you always use " " to denote Strings. do not use ' ' . Strings can have spaces in them.
36 #Floats store real numbers (ie numbers with decimal points) so numbers such as 1.234
```

The image on the previous page is code viewed in Notepad. The above image is code viewed in a new program called **Notepad++** that you need to [download](#). It will be almost impossible to read instructions and code if you're not using Notepad++!

Who wrote these learning materials?

Riaz Moola, a former UKZN student currently studying Artificial Intelligence and Computer Science at the University of Pennsylvania and the University of Edinburgh wrote all these documents and designed these notes. Riaz Moola reserves full rights on all the materials you have been provided with.
